Google Cloud H2S

AI Builder Cup

Build in JAPAC.
Build for the world.

Team Details

a. Team name: **Agentic Minds**
b. Team leader name: **Madamanchi Ashok Chowdary**
c. Team member name: **Venkat Praneeth Reddy**
d. Problem Statement: **Future of Work & Enterprise Productivity** — engineers lose most of their week to the toil around code (tests, reviews, builds, deployments). **Prompt2Prod** turns a plain-English request into a planned, tested, reviewed and deployed change.

Brief about the idea

Prompt2Prod is an autonomous AI dev crew on Google Cloud. A developer describes a change in plain English — typed, spoken, or sent from any tool via REST/webhook — and a team of Gemini agents built with Google ADK ships it end-to-end:

1. **Plan** against the real codebase — steps, files, acceptance criteria, risk (Gemini 3.1 Pro)
2. **Write failing tests first** (TDD) for every acceptance criterion
3. **Implement** with sandboxed file & test tools, iterating until the suite is green
4. **AI code review** — quality score, risk level; blocking issues go back to the Coder
5. **Build** with Cloud Build and deploy a **live preview revision** on Cloud Run
6. **Verify the live preview** with AI-generated smoke tests and Gemini visual QA
7. **Release** automatically (Autopilot) or with one-click approval — and roll back in one click

Every thought, tool call and test run streams live to a Firebase-powered dashboard.

stages · 4 quality gates · 0 hand-offs

Opportunities

🧭 How is it different?

Copilots stop at code suggestions in the IDE and CI/CD only runs pipelines you hand-write. Prompt2Prod closes the **whole loop** — plan → tests → code → review → build → preview → verify → release — on **real infrastructure** (Cloud Build images, Cloud Run revisions), with an audit trail for every change.

⚙️ How does it solve the problem?

It removes hand-offs and waiting: no review queue, no build babysitting, no deploy ritual. Quality is enforced by default — **tests first, AI review, live verification** — while humans stay in control with approval mode, a preview URL for every change and **instant rollback**.

⭐ USP

- **Test-first, self-healing** agent crew (Google ADK)
- **Live preview URL per change** via Cloud Run revision tags
- **AI smoke tests + multimodal visual QA** on the deployed preview
- **Autopilot gate** + human approval + one-click rollback
- Built-in **DORA metrics** & cost per change
- Requests from **anywhere**: UI, voice, REST, webhooks

List of features offered by the solution

Natural-language intake
Dashboard, voice (Web Speech), developer CLI, REST/webhook intake.

Planner agent
Repo-aware plan, acceptance criteria, risk & effort estimate; declines unsafe asks.

Tests-first
Test Author writes failing pytest tests before any code changes (TDD red).

Coder agent
Sandboxed read/write/edit/search/run-tests tools; iterates to green.

Self-healing
Failures are fed back automatically — up to 3 healing attempts.

AI code review
Score 0-100, risk, issues; blocking issues trigger an automatic fix round.

Preview per change
Cloud Build image → tagged Cloud Run revision with its own URL, 0% traffic.

Live verification
Verifier writes HTTP smoke tests, runs them on the preview and self-corrects bad checks.

Visual QA (multimodal)
Gemini looks at a screenshot of the live preview to confirm the UI change.

Autopilot or approval
Release when all gates pass, or wait for one-click human approval.

Instant rollback
Traffic back to the previous revision + git main reset in seconds.

DORA & cost insights
Deploy frequency, lead time, change-failure rate, MTTR, tokens & $ per change.

Process flow diagram or Use-case diagram

Prompt2Prod — from developer prompt to production

Ten stages, four quality gates, zero hand-offs. Median prompt → production ≈ 2 minutes (measured).

1 · Intake
Dashboard · voice · REST
Firebase-authenticated request, rate-limited, queued in Firestore.

2 · Sandbox
Cloud Run Job
Isolated container per task; repo restored from git bundle.

3 · Plan
Planner · Gemini Pro
Steps, files, acceptance criteria, risk, effort estimate.

4 · Tests first
Test Author
Writes failing pytest tests (TDD red phase).

5 · Implement
Coder
Edits code with sandboxed tools, runs tests, iterates.

6 · Test & heal
Test Runner + Coder
Clean pytest run; failures auto-fixed (≤3 attempts).

7 · AI review
Reviewer · Gemini Pro
Score, risk, issues; blocking issues go back to the Coder.

8 · Build
Cloud Build
Commit → container image in Artifact Registry.

9 · Preview + verify
Deployer · Verifier
Tagged Cloud Run revision; AI smoke tests + Gemini visual QA on the live URL.

Gate 1 · Tests green
Full suite incl. the new TDD tests must pass in the sandbox.

Gate 2 · AI review
Verdict approve, risk not high; one automatic fix round.

Gate 3 · Live checks
All smoke tests pass against the real preview revision.

Gate 4 · Release policy
Autopilot ships when gates 1–3 pass; Approval mode waits for a human.

10 · Released 🚀
100% traffic to the new revision, main fast-forwarded, release recorded (DORA metrics).

Awaiting approval
Preview URL ready to try; one click to approve & release or reject.

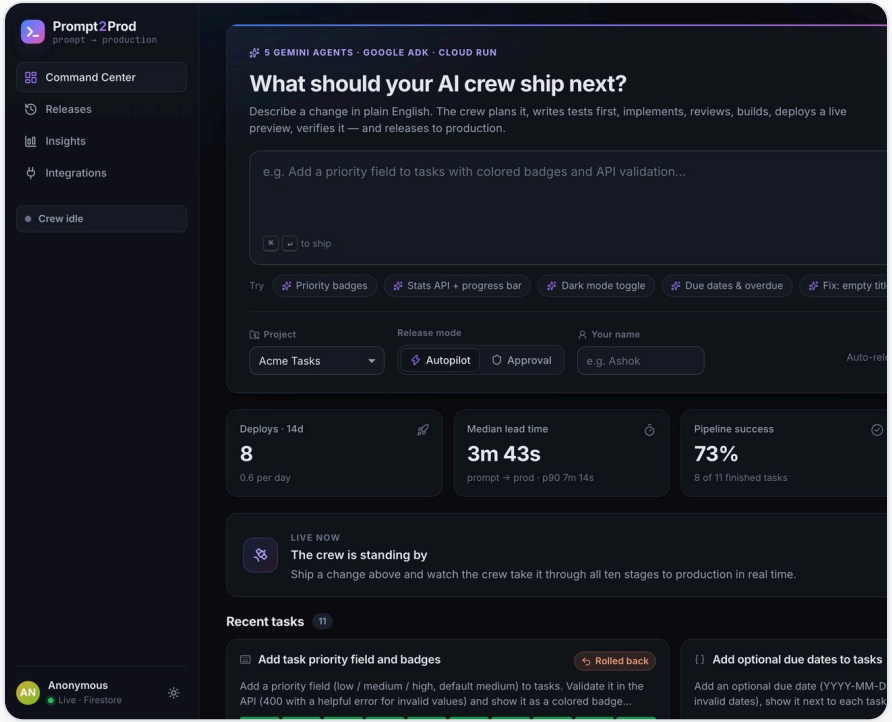

Rollback ↩
One click: traffic back to the previous revision and main reset — production restored in seconds.

⚡ Live: every thought, tool call and test run streams to the dashboard via Firestore

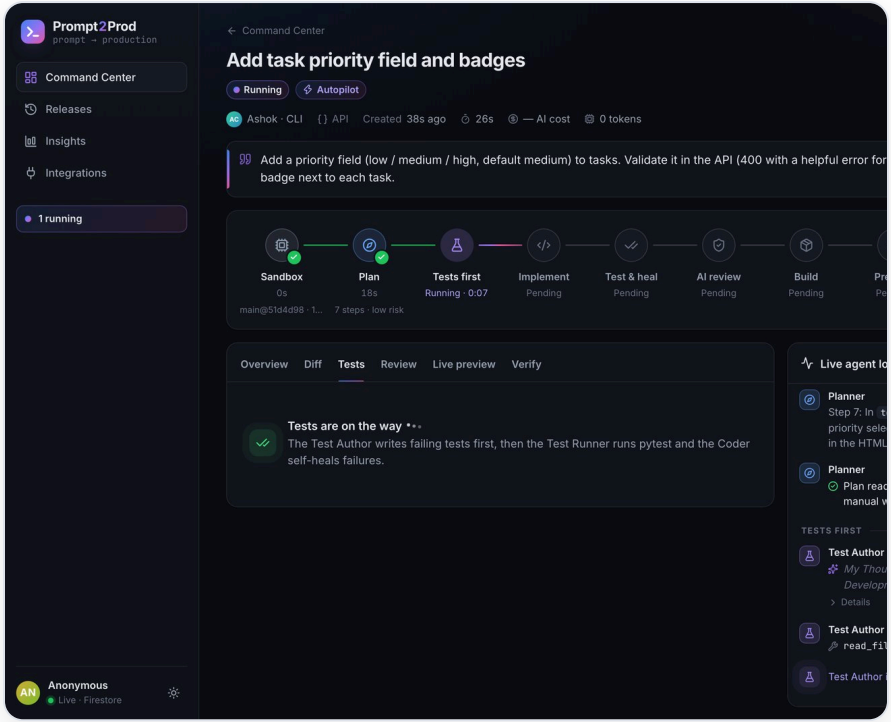

Cost & tokens metered per change

Target app runs with a zero-permission service account

Wireframes/Mock diagrams of the proposed solution (optional)

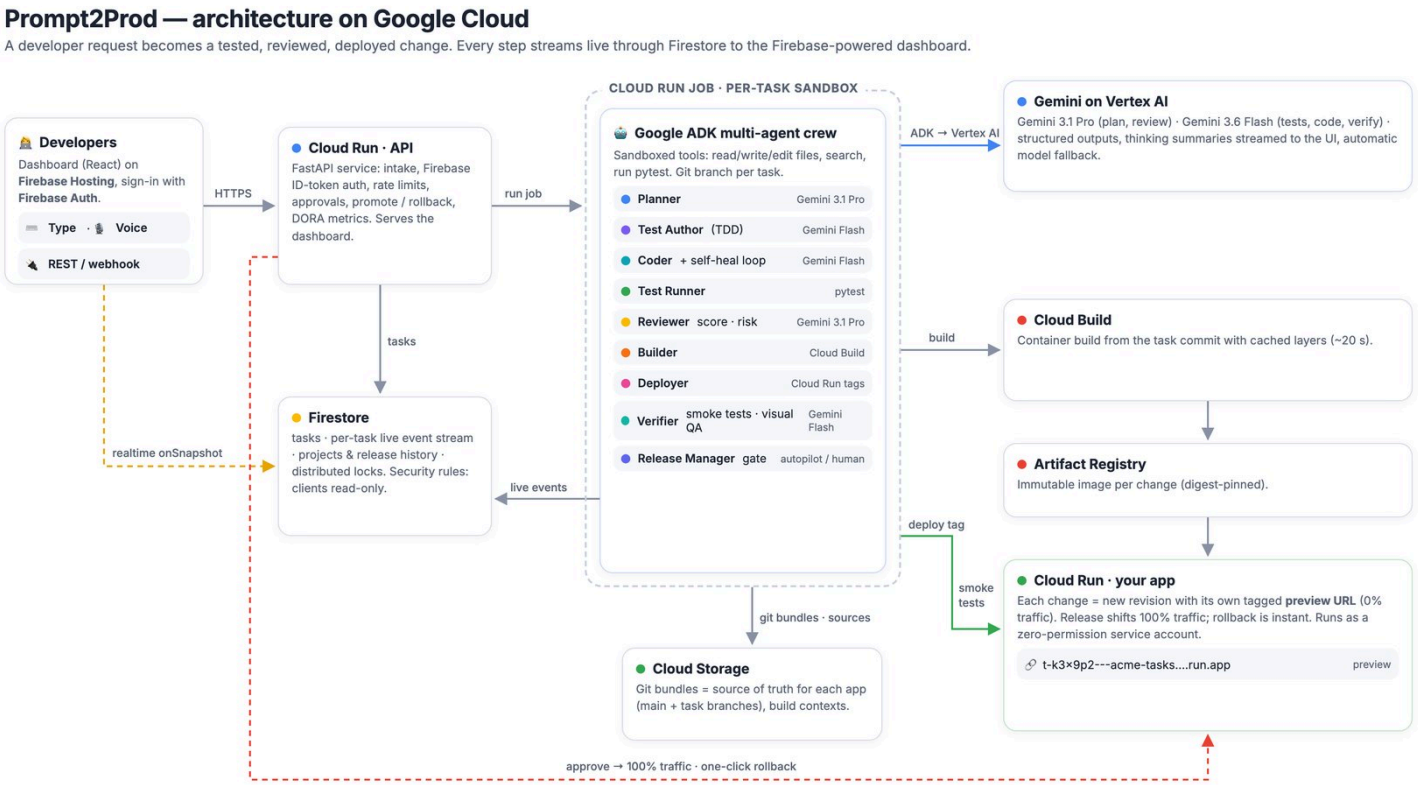

Command Center — compose a request, pick Autopilot or Approval, watch live runs

Task view — 10-stage pipeline, live agent log, plan / diff / tests / review / preview tabs

Architecture diagram of the proposed solution

Technologies to be used in the solution

Gemini on Vertex AI
Gemini 3.1 Pro (Planner, Reviewer) + Gemini 3.6 Flash (Test Author, Coder, Verifier); structured outputs, thinking summaries, model fallback.

Google ADK
Multi-agent crew of LlmAgents with function tools, output schemas and per-role thinking levels.

Cloud Run (service)
FastAPI API + dashboard; Firebase ID-token auth, approvals, releases, metrics.

Cloud Run Jobs
One isolated sandbox execution per request; runs the agents, git and pytest.

Cloud Run revisions & tags
Preview URL per change, traffic switch for release, instant rollback.

Cloud Build + Artifact Registry
Container image per change with layer caching (~20 s builds).

Firestore
Tasks, live per-task event stream, release history, distributed locks.

Firebase
Auth (anonymous sign-in), Hosting (prompt2prod.web.app), JS SDK realtime listeners.

Cloud Storage
Git bundles as source of truth for each app + build contexts.

IAM & Logging
Least-privilege service accounts; target app runs with zero permissions.

App stack
Python 3.12, FastAPI, pytest, git · React + Vite dashboard.

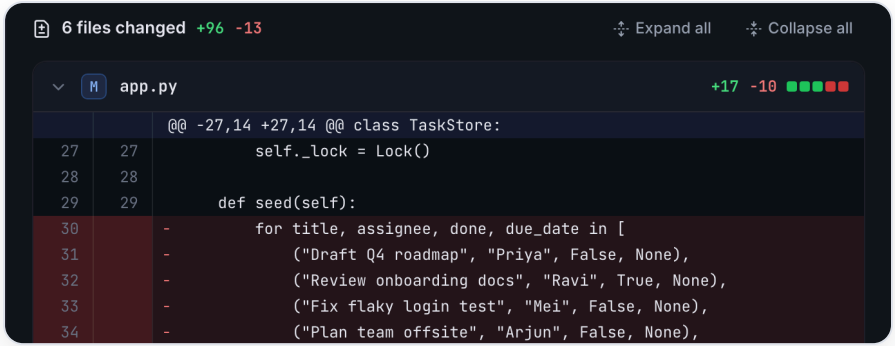

Estimated implementation cost (optional)

Per shipped change (measured)	Cost
Gemini tokens (avg 169K tokens, 18 LLM calls)	$0.15
Cloud Build (~20 s, cached layers)	≈ $0.001
Cloud Run Job sandbox (2 vCPU · 2 GiB · ~2 min)	≈ $0.006
Preview revision (scale-to-zero) · Firestore · Storage	< $0.001
Total per change	**≈ $0.16**

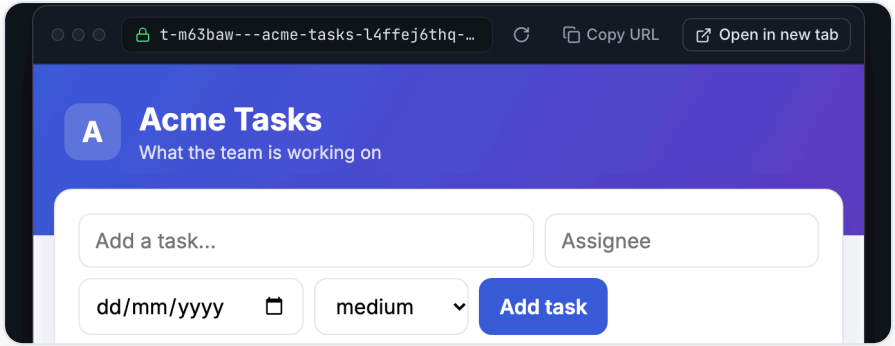

Team of 25 engineers · 400 changes / month	/ month
AI + build + sandbox	≈ $63
API + dashboard (1 warm Cloud Run instance)	≈ $30
Firestore · Storage · Artifact Registry	≈ $5
Platform total	**≈ $98**

vs. ~2.1 engineer-hours estimated per change by the Planner → hundreds of hours returned to the team every month. Prototype runs fully on the $300 Google Cloud trial.

Snapshots of the prototype

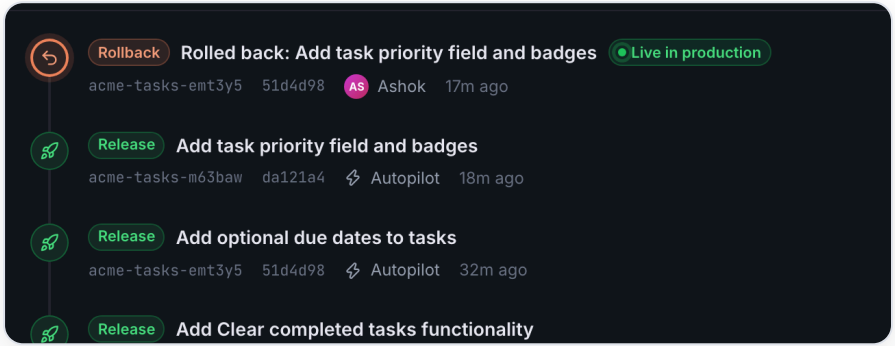

AI-written diff (6 files, +96 –13), tested, reviewed 100/100 and committed

Live preview: the tagged Cloud Run revision embedded in the task view

Insights — DORA & AI-productivity metrics computed from real runs

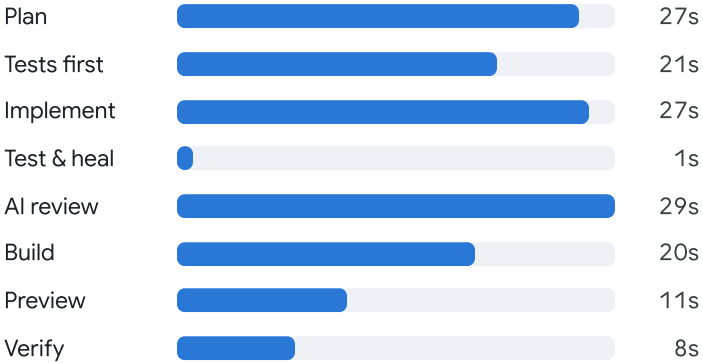

Releases — autopilot & human-approved releases, rollbacks, revisions, commits

Prototype Performance report/Benchmarking

Real request (Acme Tasks app)	Pipeline	Files	Tests (new)	Review	Live checks	AI cost
Reject empty task titles with 400 error	1m 24s	2 (+9)	13/13 (+1)	100	5/5	$0.05
Add assignee filtering to tasks API	1m 27s	2 (+26)	12/12 (+1)	100	4/4	$0.05
Add client-side task search filter	1m 30s	4 (+55)	13/13 (+0)	100	4/4	$0.09
Add Clear completed tasks functionality	1m 41s	6 (+63)	15/15 (+2)	100	5/5	$0.12
Add stats API and task completion progress	2m 01s	6 (+62)	11/11 (+2)	100	3/3	$0.11
Add task priority field and badges	2m 18s	6 (+96)	24/24 (+5)	100	5/5	$0.18
Add task priority field and badges	2m 51s	6 (+85)	23/23 (+4)	100	4/4	$0.22

9 measured end-to-end runs · median pipeline 1m 51s · median Autopilot lead time 2m 27s (excluding time waiting in the queue) · every run ended with a green suite and a 95–100 AI review. Tuning per-agent models & thinking levels cut the first run from 5m 15s to ~1.5 min; three early runs paused at the live-check gate because of a verifier bug (now self-correcting) and were re-run.

Average seconds per stage

Real catch, task m5cahc: the AI Reviewer flagged a CSS selector typo (`.new-task` → `.new_task`) that would have broken the form styling — invisible to every unit test. The Coder fixed it automatically, the re-review approved, and Autopilot shipped it in 3m 03s.

Additional Details/Future Development (if any)

🔌 Connect real repos

GitHub/GitLab apps: issue → PR with preview link, review comments, merge on approval. Monorepos & multi-service changes.

🧩 Any stack

Buildpacks + language packs (Node, Go, Java); Agent Engine for long-running, resumable agent sessions; codebase RAG with Vertex AI Search for large repos.

🚦 Progressive delivery

Canary traffic splits with Cloud Monitoring SLOs and automatic rollback; feature flags; scheduled releases.

🛡️ Enterprise guardrails

Policy-as-code (protected files, budgets), per-tenant least-privilege sandboxes, VPC-SC, SSO via Identity Platform, audit export to BigQuery.

💬 Team copilots

Slack / Google Chat intake, standup summaries of shipped work, release notes generated from commits.

🧠 Learning loop

Agents learn from review feedback and rollbacks; org-wide conventions captured automatically in AGENTS.md.

Security, guardrails & responsible AI

🔒 Isolation

Every request runs in its own Cloud Run Job container (gVisor sandbox) on a fresh git branch; agents can only touch files inside the repo.

🪪 Least privilege

The deployed app runs as a service account with zero IAM roles. Dashboard clients get read-only Firestore access via security rules.

🙋 Human in the loop

Approval mode, preview URL per change, reject at any time, one-click rollback; autopilot only ships when tests, review and live checks all pass.

🎯 Scope control

The Planner declines unsafe or out-of-scope requests; the Test Author may only edit tests/; reviewers flag security issues.

💸 Abuse & cost limits

Firebase-authenticated intake, per-user and daily rate limits, per-run LLM call caps, cost metering per change.

🧾 Full audit trail

Plan, prompts' outcome, diff, tests, review, build, release and rollback events are stored per task in Firestore and git.
